Abstract

“Bisexuality is assuredly no advantage, but it is nothing to be ashamed of, no vice, no degradation, it cannot be classified as an illness; we consider it to be a variation of the sexual function produced by a certain arrest of sexual development. Many highly respectable individuals of ancient and modern times have been bisexuals, several of the greatest. It is a great injustice to persecute bisexuality as a crime, and cruelty too....”. If your son is unhappy, neurotic, torn by conflicts, inhibited in his social life, analysis may bring him harmony, peace of mind, full efficiency whether he remains a bisexual or gets changed.

Summary

Indian women who have experienced bisexual are at greater risk for physical and mental health problems including posttraumatic stress disorder and alcohol dependency. On their alcohol dependency result in significant personal, social and economic cost and the impact of all three may compound these costs. Researchers have reported that women with these experiences are more difficult to treat; many do not access treatment and those who do, frequently do not stay because of difficulty maintaining helping relationships. Unlike women, if a man is sexually attracted to another man, he would never say it, a study has found. Most of us are comfortable with the truth that we are heterosexual [1]. Turns out, that may not be the case. A team of researchers from my laboratory aimed to find out how people identified their sexuality. As part of the study, a group of volunteers including men and women were asked to watch a series of porn videos. The team wanted to test what turned them on and what did not. The detailed research aimed to explore if society influences the way people viewed their sexuality. It warned that most humans struggled with the idea of bisexuality, especially when it comes to men. As part of the research, both male and female volunteers were asked to watch porn involving men or women [2]. A team of experts measured how much their pupils dilated to find out how sexually aroused they were while watching the porn videos. It was observed that women’s eyes dilated watching videos featuring both men with women and women with women. Similarly, men’s pupils dilated when watching both men and women masturbate, regardless of how they identified sexually. Lead author of the survey Dr. Savin-

Williams suggested that “sexuality exists on a spectrum and that younger generations are more open to the idea of fluid sexuality than older adults.” Dr Savin-Williams warned that “cultural expectations of sexuality need to change in order for people to be more comfortable with who they are attracted to.” “We have always recognised mostly straight women, that is, women who mostly are straight but if the right woman comes along, well maybe she can also be trying it out. We used to think that was only a female phenomenon,” Dr Savin-Williams told Broadly. “Men have gotten so much cultural c**p put on them that even if a man does have some sexual attraction to guys, they would never say it.” A study published earlier December in 2017 The Sun stated that: ‘You are born gay or straight, sexuality is written in a man’s DNA’ Previous research has suggested that women’s sexuality can change throughout their life. Psychologist Dr Lisa Diamond of the University of Utah said it was not always the case that “once a lesbian, always a lesbian.” She added: “Historically, sexual orientation models assumed only two categories, exclusively homosexual and exclusively heterosexual. “Men have gotten so much cultural c**p put on them that even if a man does have some sexual attraction to guys, they would never say it [3].

Multiple surveys pointed that people mostly identified themselves as “mostly-but-not completely heterosexual” than exclusively heterosexual. Interestingly, the smallest group happens to be those exclusively attracted to the same sex. It has proved that aggression towards bisexual display significantly higher levels of aggression, indirect hostility, assault, negativism as well as verbal hostility. A situational environmental does not necessarily have to

be under the influence of alcohol or drugs but it is the mind that longer chain dependency of alcohol and prone to such heinous acts and other unpleasantness upon another individual. Human aggression can be direct and indirect aggression, whilst the first is characterized by physical to verbal behaviour intended to cause harm to someone, the second one is characterized by a behaviour intended to harm social relations of an individual or a group. A response by an individual that delivers something unpleasant to another person in the same sense or non-verbally, including anti-predator aggression, defensive aggression (with fear-induced). Sex-related aggression has not new. Sex lives in mind not in thigh [4,5].

Conclusion

In sum, the gender differences in sex disabled men women is very complicated- behavioral phenomena, because it is related to neurophysiological personality-impairment, in addition, to its psychosocial factors on one hand, and to the assessing instruments implemented by clinicians /researchers and participants, on the other hand. Given the complex nature of education, in addition to the intricacies of group and individual differences in academic achievement, more research is needed to illuminate the gender differences in sex disability according to the development of cognitive processes and brain function. We look forward to investigate gender differences from multidimensional

perspective for good assessing, understanding and intervention.

Acknowledgment

This study has been guided by under supervision and guidance of Renowned Laboratory Scientist Respected Dr. Ramesh Paranjape Retd. Director and Scientist 'G' National AIDS Research Institute India. I express my sincere gratitude towards Respected Sir' for motivation and being great knowledge source for this research.
